Community Advisory: Surface Water Management District Stream Condition Survey Activity

Bath Township, OH - The Summit County Engineer has hired the engineering consulting firm of Sustainable Streams, LLC to perform a condition survey of the streams and ditches draining into the Yellow Creek watershed. The majority of this drainage network is within Bath Township, with some segments extending into adjacent jurisdictions such as Copley Township, Sharon Township, Granger Township, Richfield Township, the Village of Richfield, the City of Fairlawn, the City of Cuyahoga Falls, and the City of Akron. This field evaluation is an essential first step of our study to plan drainage improvements to be undertaken by the Surface Water Management District.

These streams are located outside the roadways, some within easements or on township land, and some without easement on private property. Accordingly, it will be necessary for Sustainable Streams staff to enter private properties in order to observe the current field conditions of these streams.

Sustainable Streams engineers will carry personal identification, including driver's licenses and business cards, and a copy of a letter on Summit County Engineer official letterhead explaining the project. The condition survey is scheduled to start approximately December 3, 2018 and will likely be completed by the end of December, with potential follow up site visits in January through April of 2019.

If you have project concerns or would like additional information on the details of this project, please contact David Koontz, PE, SI (330-643-8537).
